SITGURU · LIVE ASSESSMENT · 12 NOVEMBER 2026 (AFTERNOON) · VERSION 2

None of the four companions is Muse-like yet

Full rollup of the live SitGuru AI companion assessment - all 400 stress-test questions now complete - the shared defects behind the failures, a phased fix plan, and a complete Cursor agent prompt in Appendix A that can be pasted in as-is.

The headline numbers - final

Companion	Role	Live-tested	Result
Rogue	Pet Parents	100 of 100, 8:50-9:40 AM EST	**23 / 100 passed**
Scout	Gurus	100 of 100, 9:41-10:08 AM EST	**31 / 100 passed**
Taco	Ambassadors	100 of 100, 10:08-10:45 AM EST	39 / 100 passed
Delilah	Pet Events	100 of 100, 10:45-11:25 AM EST	**31 / 100 passed**
Total - all 400 questions complete			**124 / 400 = 31%**

> **The verdict:** none of the four is Muse-like yet. Taco is highest at 39 of 100, Rogue lowest at 23 of 100, and Scout and Delilah tie at 31. The companions can open a conversation, stay in character, and reply fast - but they cannot yet remember, answer from the real site, or complete a task, which are the three things that would make them personal assistants like Muse instead of scripted chat widgets.

What changed in version 2: the Scout, Taco, and Delilah 100-question runs are finished and scored in full in Section 4; the shared-defect list grows from eight to ten, adding Delilah's truncated event digest and Scout's intent-classification failure; and Appendix A and the re-test protocol in Section 9 are updated to match.

1. How the test was run, and what counted as a pass

The test bank holds 400 questions - 100 per companion - each with an expected correct answer grounded in SitGuru.com as checked live on 12 November 2026: the homepage services and payment list, search results, booking Step 1, the Become a Guru page, PetPerks terms, the Ambassadors page, and the Events listings.

Scoring rule

A question **passes** only if the reply matches the expected answer, gives a correct working link or button for the next step, and invents no fact. A question **fails** on any one of these:

- **Loop** - a canned reply that ignores the question, most often asking for city or ZIP again.
- **Forgot context** - losing a name, city, ZIP, service, or pet given earlier in the same chat.
- **Hallucination** - stating a fact the site does not publish, such as a background-check guarantee.
- **Fake escalation** - claiming a message was sent to a live teammate who never appears.
- **Wrong link, wrong geography, wrong price** - including invented Guru names, distances, fees, or availability.
- **No action** - answering in words when the job was to produce a search link, profile checklist, application link, or RSVP link.

Ground truths the scoring rests on

- Services: walks, drop-ins, sitting, boarding, and day care. Payments listed: Stripe, PayPal, Apple Pay, Google Pay, Venmo, and Plaid. Apps are coming soon, not live.
- Harrisburg ZIP 17101 returned 0 Gurus nearby; "Show all Gurus" showed 72 Gurus site-wide.
- Booking Step 1 showed "Marketplace Support - Free" during launch. No $2.99 fee is published in the Help Center.
- Payouts are released 48 hours after care is completed. One checked Guru's terms gave a full refund until 48 hours before a booking.
- PetPerks: Give $10 Get $10 after a friend's first eligible paid booking; Refer a Guru Earn $20 after approval and a first eligible paid booking. Credit only, not cash.
- Events: 91 listed in total, 11 in Philadelphia County. Manayunk is in Philadelphia.

2. Rogue batch by batch: 23 of 100

Batch	Questions	Focus	Passed
1	R1-R20	Core FAQs	**0 / 20**
2	R21-R40	Booking flow	9 / 20
3	R41-R60	Pricing, fees, locations	**3 / 20**
4	R61-R80	Trust, PawReport, support	5 / 20
5	R81-R100	Memory, multi-turn, edge cases	6 / 20
Total			**23 / 100**

Batch 1 - R1-R20: 0 of 20, the collapse that defines the problem

Once the first question triggered Rogue's location flow, Rogue never left it. Nineteen of twenty replies were the same canned line, word for word:

> *"For pet care, I'm on it - what city and state or ZIP where you need care?"*

Services, pricing, PawReport, reviews, payments, and cancellation all received that line. The one different reply, R16, was a generic SitGuru pitch that did not answer what Reads is.

Batch 2 - R21-R40: 9 of 20, the best batch, because a real Guru was named

Passed: R22, R23, R28, R29, R30, R36, R38, R39, R40.

- R22 found Amanda Costello's card, with working View profile and Book links.
- R23 named what booking needs - dates, pet, and a first message. R28 covered what happens after a request, R29 rebooking the same Guru, R30 booking for two dogs.
- R38 listed the payment stack correctly for Venmo; R39 correctly refused cash and routed payment through SitGuru checkout; R40 covered leaving a review after a visit.

Failed: R21, R31-R35 looped on service keywords. R24 hallucinated that next weekend "works great" without checking availability. R37 invented a Step 2 definition that contradicted R23. R26 and R27 gave garbled signup replies ("Tap ," with the button label missing), and R27 repeated the same reply after the user said they did not want an account yet. R25 omitted the full-refund-until-48-hours term.

3. Rogue, batches 3-5: fees dodged, support faked, memory half-present

Batch 3 - R41-R60: 3 of 20, pricing was the worst block

Passed: R41 (walk cost varies; Gurus set their own rates), R56 (Harrisburg correctly reported as having no dog-walking Gurus yet, with no one invented), R60 (Pittsburgh, same correct empty result).

- The entire price and fee block, R42-R55, fell into the location loop: the $2.99 fee, who pays it, when it starts, a $5 fee, a 20% Rover-style fee, PetPerks, tax, paying the Guru directly, and Marketplace Support. Rogue never asserted a false fee - but it never answered either.
- R48 was the first fake teammate fallback in 60 questions: a live teammate was claimed and never appeared in the following 12 questions.
- R49 forgot that R41 had just established that Gurus set their own rates.
- R57-R59 returned a generic "real SitGuru scoop" template naming no Guru and linking nowhere. R58 answered an Allentown walker question with an unrelated PawReport guide.

Batch 4 - R61-R80: 5 of 20, and the most serious single failure

Passed: R61 trust steps, R63 reviews, R64 what PawReport is, R65 updates during a booking, R75 cats via drop-ins and sitting.

- **R62 hallucinated "Yes" to background checks.** SitGuru states no such claim on the pages checked. This is a trust-and-safety misstatement, not a style flaw.
- **R66-R69 were four fake teammate fallbacks in a row** - Guru cancels, user cancels, contact support, report a problem. Every escalation path a worried user would take ended in a person who does not exist in the chat.
- Eight more loops covered payment security, pet events, the Partner Network, an elderly dog, medication, the app, and sign-in. R71 again misnamed PetPerks as "PawPerks" and still could not explain Reads.

Batch 5 - R81-R100: 6 of 20, memory is inconsistent, not absent

Passed: R83 services recall, R84 previous-question recall, R87 no invented $5 sitter, R88 no safety guarantee, R89 taxes out of scope, R90 a dog joke.

All 14 failures were the same location loop, including the user's name, "Are you a real person?", "Summarise what we discussed", and "How do I start over?". Rogue forgot Harrisburg ZIP 17101, and looped on Colorado, Virginia, Michigan, and New Jersey even though the homepage lists real Gurus in all four states. Yet it had silently retained the dog's name, Max, using "for Max" unprompted in R89 and R90. The memory exists somewhere in the system; it is simply not available to the part that answers.

4. Full scorecard: all 400 questions, batch by batch

Every companion was tested with 100 questions in the same chat, in batches, on 12 November 2026. Rogue's detail is in Sections 2-3 and is unchanged. This section gives the complete batch record for all four.

Companion	Batch scores	Total
Rogue (Pet Parents)	B1 0/20 · B2 9/20 · B3 3/20 · B4 5/20 · B5 6/20	**23 / 100**
Scout (Gurus)	B1 8/20 · B2 4/20 · B3 3/20 · B4 0/20 · B5 16/20	**31 / 100**
Taco (Ambassadors)	B1 11/20 · B2 10/20 · B3 7/15 · B4 4/15 · B5 7/30	**39 / 100**
Delilah (Pet Events)	B1 9/20 · B2 7/20 · B3 0/15 · B4 6/15 · B5 9/30	**31 / 100**
Total		**124 / 400**

Rogue - batch focus (detail in Sections 2-3)

Batch	Questions	Focus	Passed
1	R1-R20	Core FAQs	**0 / 20**
2	R21-R40	Booking flow	9 / 20
3	R41-R60	Pricing, fees, locations	**3 / 20**
4	R61-R80	Trust, PawReport, support	5 / 20
5	R81-R100	Memory, edge cases	6 / 20

Scout - batch record

Batch	Questions	Passed	Running
1	S1-S20	8 / 20	8 / 20
2	S21-S40	4 / 20	12 / 40
3	S41-S60	3 / 20	15 / 60
4	S61-S80	**0 / 20 - first zero batch**	15 / 80
5	S81-S100	16 / 20	**31 / 100**

4. Scout in detail: 31 of 100

Batch 1 - S1-S20: 8 of 20

Passed: schedule, service area, rates, Guru Academy (correctly described as optional), Pet Parent discovery, Scout's own job, training, and house sitting.

Failed: the first 4 questions all received the same canned location loop, and 8 questions received fake live-teammate fallbacks - PawReport, accept every request, messaging, reviews, Success Center, PA-only, students, and medication help. Several of those facts are published on the very /become-a-guru page Scout sits on. There were no hallucinations in this batch.

Batch 2 - S21-S40: 4 of 20 (12 of 40)

S21 gave a strong 7-step Guru walkthrough. Then S22 flipped Scout into Pet Parent mode and it stayed stuck: 12 questions received Rogue's location loop ("For Dog Walking, I'm on it - what city and state or ZIP where you need care?"). Passed: S21, S27 (no set approval timeline), S28 (submitted profile), and S30 (edit availability). S29's fake-teammate fallback contradicted S7, where Scout had correctly said Gurus control their pricing.

Batch 3 - S41-S60: 3 of 20 (15 of 60)

All 17 failures were the location loop - Scout remained stuck in Pet Parent mode. Passed: S51 taxes, S52 tips, and S53 platform charges (borderline, with teammate-flag framing). Scout never hallucinated a fee in this batch, but it never answered the $2.99, 20%, 11%, PetPerks $20, monthly fee, or future $2.99 questions either.

Batch 4 - S61-S80: 0 of 20 (15 of 80)

All 20 answers were the location loop - Rover, safety, cancellation, PawReport, Guru Academy, a sick pet, and a difficult Pet Parent all went unanswered. S68 named Harrisburg in the question itself and Scout still asked for city and ZIP. S76 contradicted S8, where Scout had correctly said Guru Academy is optional.

Batch 5 - S81-S100: 16 of 20

Once explicit context was given in one statement - Jordan in Harrisburg doing dog walking, then Priya in Philadelphia doing boarding - Scout broke out of the loop and passed 16, correctly refusing in-chat profile setup, a status check, a referral link, a background check, a client booking, a $5,000/month promise, weather, and a fake Guru name. Failed: S81 (loop), S86 and S87 ("Scout hit a snag" errors after 60-75 seconds of typing), and S100 (a generic summary instead of a Priya / Philadelphia / boarding plan).

> **Key insight:** Scout's loop looks like an intent-classification failure on standalone questions, not an inability to hold context. Give it name + city + service in one statement and it works. The fix is intent routing before the intake script runs - not more memory.

4. Taco in detail: 39 of 100

Batch	Questions	Passed	Running
1	T1-T20	11 / 20	11 / 20
2	T21-T40	10 / 20	21 / 40
3	T41-T55	7 / 15	28 / 55
4	T56-T70	4 / 15	32 / 70
5	T71-T100	7 / 30	**39 / 100**

Batch 1 - T1-T20: 11 of 20

Passed: become an Ambassador, what Ambassadors do, referral link / QR / tracking, students, Ambassador + Guru, no social media needed, no followers needed, and sharing on Facebook, TikTok, and Instagram.

Failed: 8 fake live-teammate fallbacks, including T1 (what is an Ambassador), T3 (where to sign up), and T17 (Taco's own job). T7's PetPerks answer was incomplete, with no $10 / $20 amounts and no link. Taco gave no links at all in any reply in this batch. Its greeting still promises "$10 to $20 PetPerks rewards" - unverified.

Batch 2 - T21-T40: 10 of 20 (21 of 40)

Passed: T21 join flow, T26 and T27 referral link, plus borderline passes T28, T29, T32, T33, and T34, where Taco admitted it had no confirmed answer but still invoked the fake teammate handoff.

Failed: T22 failed immediately after T21 had covered the same ground, and T23 (approval time) also failed; T24 and T25 gave no application link; T30 nudged businesses toward Ambassador instead of the Partner Network; T31 hallucinated rescue Ambassador eligibility; T36 and T38 gave inconsistent sign-up links - Taco confirmed /programs/ambassadors/apply in T37, then could not give one consistent link in T38; and T39 never acknowledged that two destinations exist.

Batch 3 - T41-T55: 7 of 15 (28 of 55)

Passed: link and QR mechanics, QR on a flyer, sharing in a Facebook group, where the dashboard is, and the admission that it cannot show metrics or fetch a link in chat - T55 correctly contradicting its own greeting's "I will fetch your link" promise.

Failed: the tracking cluster collapsed (T44-T47 and T49) into fake teammate fallbacks, even though Taco had said the dashboard tracks clicks and activity; T50 and T51 evaded the first-eligible-paid-booking rule; T51 cited an unverified /ambassador/dashboard/referrals path; and T52 conflated PetPerks with the Ambassador dashboard and never mentioned PawPerks.

4. Taco in detail, continued

Batch 4 - T56-T70: 4 of 15 (32 of 70) - the weakest Taco batch

Passed: T56 and T61 (rewards are not guaranteed), T57 (correctly refusing to confirm the unverified $10-to-$20 figure), and T63 (refusing a $100 promise).

Failed: every specific PetPerks mechanic - Give $10 Get $10, Refer a Guru $20, cash format, unlock timing, free booking, PawPerks, PetPerks vs PawPerks, credit use, expiry, self-referral, and a missing credit. Eleven of the 15 answers contained a fake live-teammate handoff.

Batch 5 - T71-T100: 7 of 30

Taco failed every direct recall question - Philadelphia, Alex, Ambassador, Penn State, and Sam - yet used the correct names unprompted in T75, T81, and T82. The facts are in the chat; Taco cannot retrieve them when asked directly, the same memory pattern as Rogue and Delilah.

- 23 of 30 answers were the fake teammate fallback, including recursively at T93, where a question about the fallback itself received the same fallback, and at T94 ("Are you a real person?") and T95 ("Can I talk to a human?").
- **Passed on hard-limit boundaries: routing Guru questions to Scout, no in-chat signup, no referral-link generation, no Facebook ads, no Instagram posting, and routing booking questions to Rogue.**
- T96 cited /petperks as the source for the unverified "$10 to $20" figure without confirming the figure is actually written there.

> **Two Taco items stay open:** the greeting still promises "$10 to $20 PetPerks rewards", which is published nowhere on the site; and the "Claim My Referral Code" button was never clicked during testing, so its destination remains unverified. Both belong in Phase 0.

What Taco does best - and why it still is not enough

Taco scored highest of the four because its core topic - what Ambassadors do and how referral links and QR codes work - is narrow and mostly scripted correctly. It fails exactly where the other three fail: PetPerks specifics, recall on demand, and the fake escalation. Fixing the shared defects lifts Taco first, which is why the acceptance bar for Taco in Appendix A is the same 80+ as Scout and Delilah, not a lower one.

4. Delilah in detail: 31 of 100

Batch	Questions	Passed	Running
1	D1-D20	9 / 20	9 / 20
2	D21-D40	7 / 20	16 / 40
3	D41-D55	**0 / 15**	16 / 55
4	D56-D70	6 / 15	22 / 70
5	D71-D100	9 / 30	**31 / 100**

Batch 1 - D1-D20: 9 of 20

Passed: D1 (ask city first), D3 and D4 (RSVP Yes / Maybe / No, no account needed), D8 community map, D9 Eat & Drink, D10 Play / dog parks, D11 Delilah's own job, D19 Allentown (10 real Lehigh Valley events, 1 omitted), and D20 Pittsburgh (exactly 1 event: Pet Photos with Santa at Petagogy East Liberty, Nov 21).

Failed: 7 fake teammate fallbacks (D2 Philadelphia, D5 list an event, D6 free, D7 kinds of events, D13 only PA, D14 search by date, D15 save an event); D12 gave no count even though the page header says "91 events"; D16 hallucinated a Share control that does not exist anywhere on /events; D17's Philadelphia weekend list presented Lehigh Valley and Lancaster events as Philadelphia's, counted Friday Nov 13 as the weekend, put Coplay at ~35 miles (actually ~55-60) and Manayunk at ~58 miles (Manayunk is in Philadelphia), and omitted the Philly Pet Group Munch on Nov 15; and D18 claimed there were no Harrisburg events, when the live page lists 4 Dauphin County events.

Batch 2 - D21-D40: 7 of 20 (16 of 40)

Passed: D22-D25 Philadelphia date-specific questions for Nov 13-21, D36 Lehigh Valley, D37 Allentown, and D39 New Jersey (23 real NJ events, correct towns and dates).

Failed: D21, the general "What pet events are in Philadelphia?", received the fake teammate fallback; D26-D28 falsely denied Philadelphia events on Nov 29, Dec 2, and Dec 5 that are on the live list; D29-D35 and D40 - every yes/no geography and distance question - fell back, and Delilah never once stated that Manayunk is in Philadelphia; and D38 repeated the Harrisburg denial, claiming Lancaster was closest.

Batch 3 - D41-D55: 0 of 15 (16 of 55) - the worst batch in all 400

Twelve of 15 answers were fake teammate fallbacks, covering every single-event date, time, and existence question. D52 supplied the diagnosis herself: her "live digest only goes through late November". That explains the Nov 29, Dec 2, and Dec 5 false denials - the site lists January and February events (Super Pet Expo Jan 8-10, Lehigh Valley Pet Expo Feb 5, Puppy Pals Feb 7, Paws & Kisses Feb 13) that were never loaded. D50 and D51 received real answers but failed: a Manayunk event dated wrong and labelled ~58 miles, the Munch omitted, a Friday event in a weekend list, a later-this-month list with zero Philadelphia events, and Shillington at ~26 miles (actually ~55-60).

4. Delilah in detail, continued

Batch 4 - D56-D70: 6 of 15 (22 of 70)

Passed: the RSVP mechanics D56-D60 - find an event by name, tap Yes, Delilah correctly refusing to RSVP in chat on the user's behalf, change an RSVP anytime, no account needed - and D63 Create Event button (borderline: Delilah also invented a review / approval step that is not published on the site).

Failed: 7 fake teammate fallbacks on listing and hosting (list an event, list in Philadelphia, list as a Partner, fee, host a meetup, host an adoption event, who else is going); D66 and D67 invented "Partner Dashboard" edit and cancel flows instead of saying the flow is not verified; and no RSVP was actually recorded during testing - the event cards still show Yes 0 / Maybe 0.

Batch 5 - D71-D100: 9 of 30

Delilah failed every direct recall question - Philadelphia, Alex, Sam, and Allentown - yet used the correct names and context unprompted in D74 and D82. Twenty of 30 answers were the fake teammate fallback, including recursively at D92, when asked if she is a real person (D90), and when asked to talk to a human (D91).

Passed on out-of-scope routing: booking questions to Rogue, Guru signup to Scout, Ambassador signup to Taco, no London events invented, and a refusal to invent a pet policy for Pints 4 Pets.

> **A site-side note:** the site itself mis-groups Manayunk venues under Montgomery County, even though Manayunk is a Philadelphia neighborhood. That grouping should be corrected in the events data; it does not excuse Delilah's ~58-mile claim, which came from prose, not from the county field.

Reading the four scores together

- **Taco 39** leads because its topic is the narrowest - and it still fails PetPerks, recall, and escalation.
- **Scout 31 and Delilah 31** tie by opposite routes: Scout collapses into a loop for three batches, then scores 16 of 20 once context is supplied in one statement; Delilah answers real event data for near dates, then scores 0 of 15 once questions name a single event or a later date.
- **Rogue 23** trails because its job is the broadest - booking, fees, trust, and support - and each of those areas contains at least one critical failure.
- No companion passed a direct recall question in its final batch. Memory on demand failed for all four, even where the same facts were used unprompted minutes earlier.

5. Ten shared defects explain almost every failure

#	Defect	Evidence	Severity
1	**Stuck state machine.** One triggered flow (location, services) captures the conversation and no question can exit it.	Rogue batches 1, 3, 5; Scout batches 2-4 (49 loop answers)	Critical
2	**Fake live-teammate escalation - now the dominant failure across all four.** The fallback claims a human was notified; no human ever arrives. It is also recursive: a question about the fallback receives the fallback.	Taco 23 of 30 in Batch 5; Delilah 20 of 30 in Batch 5 and 12 of 15 in Batch 3; Rogue R48, R66-R69; recursive at T93 and D92; used when asked if it is a real person or to talk to a human (T94/T95, D90/D91)	Critical - trust
3	**Ungrounded answers.** Replies come from a script, not from site content, so published answers are never used.	Scout on free-to-apply; Rogue on Reads, Partner Network, fees	Critical
4	**Hallucinated trust, money, and interface claims.**	R62 background checks "Yes"; Taco's $10-$20 rewards and its /petperks citation for that unverified figure (T96); R24 invented availability; Delilah's invented Share control (D16) and invented Partner Dashboard edit/cancel flows (D66/D67)	Critical - legal/trust
5	**Conversation memory not wired to answers.** Facts are retained inconsistently and cannot be recalled or summarised on request.	Harrisburg 17101 forgotten; Max retained silently; every companion failed every direct recall question in its final batch while using the same facts unprompted	High
6	**No action output.** The companion describes instead of producing the search, booking, application, or RSVP link.	Rogue R57-R59; Taco gave no links at all in Batch 1; Delilah RSVP guidance without a recorded RSVP	High - bookings

5. Shared defects, continued

#	Defect	Evidence	Severity
7	**Geography and distance errors.** Results are not filtered or ranked by the county and distance the user asked for, and distances are estimated in prose.	Manayunk repeatedly ~58 miles (it is in Philadelphia); Coplay ~35 miles (actually ~55-60); Shillington ~26 miles (actually ~55-60); Lehigh Valley events presented as Philadelphia events; Harrisburg's 4 Dauphin County events denied twice (D18, D38)	High
8	**Inconsistent site facts underneath.** Two Ambassador sign-up links; two support addresses in circulation (the site footer shows support@sitguru.com, the test brief used pack@sitguru.com).	Taco links; support routing in R66-R69 answers	Medium - fix first, cheap
9	**Stale, truncated event digest (new).** Delilah's "live digest" only goes through late November, so she falsely denies real December, January, and February events.	D52 admission; false denials for Nov 29, Dec 2, Dec 5; Jan-Feb events (Super Pet Expo Jan 8-10, Lehigh Valley Pet Expo Feb 5, Puppy Pals Feb 7, Paws & Kisses Feb 13) never loaded. Fix: index the full live /events list, not a dated snapshot	High
10	**Intent-classification failure on standalone questions (new, Scout).** The loop is triggered by question phrasing, not by missing context: supplying name + city + service in one statement breaks the loop.	Scout B4 0 of 20 on standalone questions, then B5 16 of 20 with explicit context. Fix: intent routing before the intake script, not more memory	Critical

Corrections the testing made to its own brief

- **Signup route:** the site's actual route is /register?role=parent, not /signup as the test brief stated. Rogue's button was right; the brief was wrong.
- **Partner Network:** the homepage carousel does list seven named partners - Annabel's Touch Chiropractic, Doylestown Animal Medical Clinic, Outcast Rescue, Mostly Muttz Rescue, Zeppa Studios, Crimson Cat Studios, and Acorn Valley Pet Boarding. An earlier "no named partners" expectation was wrong. Rogue still failed R74 by naming none of them.
- **Support email:** pick one canonical address, publish it in Help, and hard-code only that address in every companion. Do not let a companion improvise one.
- **Events data:** the site mis-groups Manayunk venues under Montgomery County. Correct the county in the events data so county filtering can be right.

6. The target: what "like Muse" means for SitGuru

The goal set for Rogue, Taco, Scout, and Delilah is that each works like a personal assistant for its user type - not a FAQ chatbot. Concretely, a Muse-like companion passes five tests on every turn:

1. **It remembers.** Name, city and ZIP, service, dates, and pet names persist for the whole conversation, are used without re-asking, and can be summarised and corrected on request ("Actually I need boarding, not walking" updates the service).
2. **It answers from the site.** Every factual claim traces to an indexed SitGuru page or live data - search results, Guru profiles, Help articles, events listings - and carries the link to that page. If the site does not publish it, the companion says so plainly.
3. **It acts.** Each companion owns one primary action it must produce, not describe: Rogue returns a filtered search link (and a named Guru's profile and Book link when one matches); Scout returns a Guru-profile checklist with the next incomplete step; Taco returns the single canonical Ambassador application link; Delilah returns an RSVP or Create Event link for the right county.
4. **It never invents.** No availability, prices, fees, distances, background checks, insurance, rewards figures, or Guru names unless live data or a published page supports them. An honest empty result - "no Gurus in 17101 yet" - is a pass, as R56 and R60 proved.
5. **It escalates honestly.** When it cannot help, it says so, gives the one canonical support address, and links the page that comes closest. The words "live teammate" appear only if a real handoff system exists behind them.

> **The standard to hold:** a companion that does these five things at Rogue's current response speed (about 10-20 seconds is too slow - target under 5 seconds for a grounded FAQ answer) converts chat into bookings. A companion that does none of them trains users to ignore the widget, which is what 77 failed Rogue answers are currently teaching them.

Non-goals

- Do not book, pay, create accounts, or generate referral links inside chat until a real, authenticated tool exists for it. Guiding to the real flow with a pre-filled link is the action; claiming the action happened is a hallucination.
- Do not publish the planned $2.99 per-booking fee through a companion before it is published in Help. The correct companion answer today is the launch answer: Marketplace Support is free during launch, and the future fee is not published.

7. Fix plan - Phase 0 and Phase 1 (stop the harm, then ground the answers)

Phase 0 - Same day, before any model work

Fix	Acceptance test
Delete the fake live-teammate fallback everywhere. Replace it with an honest fallback: a short apology, the canonical support email, and the closest help page link.	Ask all four companions a question they cannot answer. None claims a teammate, a ticket, or a handoff that does not exist.
Remove Taco's "$10 to $20 PetPerks rewards" greeting claim. Replace with the published PetPerks terms: $10/$10 Pet Parent referral and $20 Guru referral, each after a first eligible paid booking, credit only.	Taco's greeting and T57-style answers contain no reward figure that is not on /petperks.
Add a hard guardrail: never answer "yes" to background checks, insurance, safety guarantees, or availability. The approved wording is the site's trust-steps wording, or "not published - here is support".	R62, R74-style, and R88-style questions produce the approved wording, never a bare yes.
Choose one canonical Ambassador sign-up URL and one canonical support email. Update the site, Help, and all four companions to use only those.	Taco gives the identical link in 10 consecutive sign-up questions; every companion gives the identical support address.
Publish a Help article answering the fee question: free during launch, Marketplace Support Free at booking, future per-booking fee not yet published with no date promised.	Help search for the fee returns the article; companions can cite it (Phase 1).

Phase 1 - Grounding: one knowledge source for all four companions

- Build a single indexed knowledge base from the live site: /search, /become-a-guru, /petperks, /ambassadors, /partners, /events, /reads, /help, and the homepage. Refresh it on every deploy and on a nightly crawl.
- Require retrieval before answering any factual question. The reply must include the source page link. No retrieval hit means the honest not-published answer, not a generated guess.
- Kill the capture-state scripts: a triggered intake flow (location, services) may ask its question once, but any unrelated user question must interrupt it, be answered, and only then may the flow offer to resume.
- Acceptance: Rogue R1-R20 re-test passes at least 18 of 20; Scout answers free-to-apply, rates, payouts, and Rover directly from Become a Guru content with the page link.

8. Fix plan - Phase 2 and Phase 3 (memory, actions, geography)

Phase 2 - Conversation memory as a real object

- Maintain a typed session state per chat: user name, role, city, state, ZIP, service, dates, pet names and species, and the named Guru or event in play. Update it on correction, never silently.
- Every answer reads state before asking anything. Asking for a fact already in state is an automatic test failure.
- Add three supported intents that read state back: "What do you remember about me?", "Summarise what we discussed", and "Start over" (which clears state and says so).
- Acceptance: Rogue R81-R90 and R98-R100 pass; the Harrisburg setup is recalled in full, Max is used consistently, and a service change mid-chat is reflected in the very next answer.

Phase 3 - One real action per companion, and correct geography

Companion	Action to ship	Acceptance test
Rogue	Filtered /search deep link built from state (ZIP, service); named-Guru profile and Book links when a profile matches; honest empty result with a notify / show-all fallback when none does.	Philadelphia returns Amanda Costello with links; Harrisburg 17101 returns an honest empty result; no state query loops.
Scout	Guru onboarding checklist generated from Become a Guru steps, with the application link and the user's next step.	"How do I become a Guru?" returns the checklist and link in one reply, no services-script capture.
Taco	The single canonical Ambassador application link, plus how the referral link and QR code arrive after approval.	Sign-up questions never trigger a fallback; the link is identical across sessions.
Delilah	County-filtered events search with computed distances from real coordinates; RSVP and Create Event deep links.	Philadelphia returns Philadelphia County events first (the 11 on file); Manayunk's distance is computed, never estimated in prose.

- Distances and availability must come from data - geocoded event and Guru locations, live availability fields - never from the language model. If the data field is empty, say so.
- Response time: log time-to-first-reply per turn. Target under 5 seconds for grounded FAQ answers; the observed 10-20 seconds is part of why scripted loops feel broken.
- Acceptance for the phase: Rogue full re-test at or above 85 of 100, with zero fake escalations and zero hallucinated trust claims at any score.

Appendix A. The Cursor agent prompt - copy everything from here

Paste the full prompt below into Cursor as one task. It is written to be self-contained: findings, ground truths, constraints, build order, and acceptance tests are all inside it, so the agent needs nothing else.

```
You are working on SitGuru.com. SitGuru has four AI chat
companions: Rogue (Pet Parents), Scout (Gurus), Taco
(Ambassadors), and Delilah (Pet Events). A live assessment
on 12 Nov 2026 tested all four companions with 100
questions each: Rogue 23/100, Scout 31/100, Taco 39/100,
Delilah 31/100 - total 124/400 (31%).
Your job: rebuild the companions so each works like a real
personal assistant for its user type - it remembers the
conversation, answers from the actual website, produces
one real action link per request, and never invents facts.

CONFIRMED DEFECTS TO FIX
1. Stuck state machine: once a location or services intake
   flow triggers, every later question gets the same canned
   reply. Rogue answered 19 of 20 core FAQs with: "For pet
   care, I'm on it - what city and state or ZIP where you
   need care?" Scout ignored 5 questions in a row, including
   its own "Free to apply?", "Payments", "My rates" buttons.
2. Fake escalation: companions claim "I sent it to a live
   teammate" and no one ever responds. Rogue did this for
   cancellation, support, and reporting a problem (4x in a
   row). Taco did it for Ambassador sign-up. Delilah did it
   for listing an event. REMOVE this fallback everywhere.
3. Ungrounded answers: replies come from scripts, not site
   content, so published answers are never used.
4. Hallucinations: Rogue answered "Yes" to background
   checks (the site claims no such thing); Rogue invented
   next-weekend availability; Taco's greeting promises
   "$10 to $20 PetPerks rewards" (not published anywhere).
5. Broken memory: Rogue forgot Harrisburg ZIP 17101 given
   in the same chat, could not summarise the conversation,
   yet silently retained a dog's name. Memory is partial
   and not readable by the answering layer.
6. No action output: location searches returned a generic
   template naming no Guru and linking nowhere.
7. Geography errors: Delilah listed Lehigh Valley events
   for a Philadelphia query (missing all 11 Philadelphia
   County events) and called Manayunk ~58 mi from
   Philadelphia. Manayunk is IN Philadelphia.
8. Inconsistent site facts: two Ambassador sign-up URLs
   (/ambassador/join and /programs/ambassadors/apply) and
   two support emails in circulation. Pick ONE canonical
   value for each, from the site config, and use only it.
9. Fake escalation, recursive cases: Taco used the
   fallback in 23 of 30 Batch 5 answers, Delilah in 20
   of 30 (and 12 of 15 in Batch 3) - including answering
   a question ABOUT the fallback with the same fallback
   (T93, D92) and using it when asked if it is a real
   person or to talk to a human (T94/T95, D90/D91). The
   phrase "live teammate" must never appear unless a
   real handoff was created, and a question about the
   fallback itself must never be answered with it.
```

Appendix A, continued

```
10. Scout intent classification: standalone questions
    are routed into a location intake script instead of
    being answered. Scout scored 0/20 on standalone
    questions (S61-S80), then 16/20 once name + city +
    service were supplied in one statement (S81-S100).
    Route by intent BEFORE any intake script runs.
11. Delilah digest cutoff: her "live digest" ends in
    late November (her own admission, D52), so she
    falsely denies real Nov 29, Dec 2 and Dec 5 events.
    Index the FULL live /events list - all 91 events,
    all dates including Jan-Feb - never a snapshot.
12. Delilah geography from data only: Manayunk is IN
    Philadelphia (distance 0, never ~58 mi); Coplay and
    Shillington were also understated (~35 and ~26 mi
    claimed, ~55-60 actual). Use county-filtered results
    and computed distances; no estimated distances in
    prose. Note: the site mis-groups Manayunk venues
    under Montgomery County - fix that data too.
13. Taco canonical link: Taco confirmed
    /programs/ambassadors/apply in T37, then gave
    inconsistent links in T36/T38. Pick ONE of
    /ambassador/join or /programs/ambassadors/apply and
    use it identically everywhere, every session.
14. No invented UI flows: never claim a Share control,
    a Partner Dashboard, a Pet Event Manager, or a
    review/approval step unless it is verified on the
    live page (Delilah invented all four patterns).
GROUND TRUTHS - NEVER CONTRADICT THESE
- Services: walks, drop-ins, sitting, boarding, day care.
- Payments listed on homepage: Stripe, PayPal, Apple Pay,
  Google Pay, Venmo, Plaid. Apps: coming soon, NOT live.
- Pet Parents join free. Signup route: /register?role=parent
  (verify against the codebase; do not hard-code /signup).
- Gurus: free to apply, set their own rates, services,
  availability, and service area; trust steps (identity,
  safety, account, payout) required before bookable; Guru
  Academy / SitGuru University is optional, NOT required.
- Payouts release 48 hours after care is completed.
- Fees: booking currently shows "Marketplace Support -
  Free" during launch. NO per-booking fee is published in
  Help. Never state a $2.99 fee (or $5, 20%, $50) as current,
  never say who pays it, never give a start date. Correct
  answer: free during launch; future fee not published.
- Rover: SitGuru is an additional channel, NOT a
  replacement. Gurus may keep Rover. Rover's ~20% sitter /
  ~11% owner fees are Rover's - never present as SitGuru's.
- PetPerks: Give $10 Get $10 after the friend's first
  eligible paid booking completes; Refer a Guru Earn $20
  after approval + first eligible paid booking. Credit
  only, never cash, never guaranteed.
- PawReport: photos, notes, walk progress, live updates
  during/after a booking - never available before one.
- Reviews: only reviews from real SitGuru visits are shown.
```

Appendix A, continued

```
- Partner Network (homepage carousel): Annabel's Touch
  Chiropractic, Doylestown Animal Medical Clinic, Outcast
  Rescue, Mostly Muttz Rescue, Zeppa Studios, Crimson Cat
  Studios, Acorn Valley Pet Boarding.
- Search facts at test time: Harrisburg 17101 = 0 Gurus;
  72 Gurus site-wide; Amanda Costello (Philadelphia),
  Sofia Martinez (King of Prussia), George Medina
  (Allentown) are real profile examples. Treat these as
  test fixtures: always query live search, never hard-code
  a Guru, price, or availability into a reply.
ARCHITECTURE TO BUILD
A. One shared knowledge base for all four companions,
   indexed from the live site pages and Help Center,
   refreshed on deploy + nightly. Factual answers REQUIRE
   a retrieval hit and must include the source page link.
   No hit = say it is not published + support email + the
   closest page link. No generated guesses.
B. Typed session state per chat: name, role, city, state,
   ZIP, service, dates, pet names/species, named Guru or
   event. Read state before every reply; never re-ask a
   known fact. Support intents: recall, summarise, correct
   ("actually boarding, not walking"), and start over
   (clears state and confirms).
C. Interruptible flows: an intake flow may ask its
   question ONCE. Any unrelated question interrupts it,
   gets a grounded answer, and the flow may then offer to
   resume. No flow may answer a question it was not asked.
D. Action tools (return links, never claim completion):
   - Rogue: filtered /search deep link from state; Guru
     profile + Book link on a match; honest empty result +
     show-all / notify option when no Guru matches.
   - Scout: Guru onboarding checklist + become-a-Guru /
     application link, with the user's next step marked.
   - Taco: the ONE canonical Ambassador application link;
     explain referral link + QR arrive after approval.
   - Delilah: county-filtered /events results, RSVP link,
     and Create Event link.
   Never claim to have booked, signed anyone up, generated
   a referral link, checked an account, or contacted a
   human inside chat.
E. Geography from data only: filter events and Gurus by
   county / service area; compute distances from geocoded
   coordinates. The model must never estimate a distance,
   availability, price, or rating in prose.
F. Guardrails (hard rules, unit-tested): never confirm
   background checks, insurance, or safety guarantees;
   never confirm an unpublished fee or reward figure;
   never invent a Guru, event, phone number, or policy.
   Approved fallback wording: state what IS published,
   say what is not, link Help, give the support email.
G. Honest escalation: if a real human handoff system
   exists, wire the fallback to it; otherwise the fallback
   is an apology + support email + closest help link.
   The phrase "live teammate" must not appear in any
   reply unless a real handoff was created.
```

Appendix A, continued

```
H. Performance + logging: log time-to-first-reply, the
   retrieved sources, session state, and failure type per
   turn. Target under 5 seconds for grounded FAQ answers
   (current observed latency is 10-20 seconds).

BUILD ORDER
Phase 0: remove fake-teammate fallback; remove Taco's
$10-$20 claim; add guardrails (F); canonicalise the
Ambassador URL and support email; add the Help article
on fees (free during launch, future fee not published).
Phase 1: knowledge base + retrieval-required answers (A)
and interruptible flows (C).
Phase 2: session state + recall/summarise/correct (B).
Phase 3: action tools (D) and data-only geography (E),
plus logging and latency work (H).
ACCEPTANCE TESTS - ALL MUST PASS BEFORE YOU REPORT DONE
Re-run the 400-question bank (100 per companion). Report
per-companion pass counts with verbatim failing replies.
Minimum bar: Rogue 85+/100; each other companion 80+/100;
ZERO fake escalations; ZERO hallucinated trust, fee, or
reward claims at any score. Spot checks: (1) Harrisburg
17101 returns an honest empty result and is remembered;
(2) Philadelphia events list Philadelphia County first;
(3) fee questions cite the Help article; (4) Scout answers
free-to-apply / rates / payouts / Rover with links;
(5) the same sign-up link and support email appear in
every companion, every session. Additional required
tests: (6) ZERO fake escalations including recursive
cases - T93/D92-style probes ("who is that teammate?")
must be answered, never re-fallbacked; (7) direct
recall of name / city / service passes for EVERY
companion (T71-T73 / D71-D73-style questions); (8)
Delilah Philadelphia queries return Philadelphia
County events first, Manayunk is treated as in
Philadelphia, and Jan-Feb events are answerable;
(9) Taco gives the IDENTICAL application link in 10
consecutive sign-up questions; (10) Scout answers
standalone free-to-apply / rates / payouts / Rover
questions with no location loop (S61-S80 style).
```

9. Re-test protocol: assessment complete - now prove the fix

Assessment complete

All 400 questions were run live on 12 November 2026, 8:50 AM-11:25 AM EST, in the same chat per companion, with no account created and nothing booked or paid. The final baselines are Rogue 23/100, Scout 31/100, Taco 39/100, and Delilah 31/100 - 124 of 400 in total. The protocol below now applies to re-testing after the fix, using the same question bank and the same scoring rule in Section 1.

Proving the fix

Gate	Threshold
Rogue full re-test	85 of 100 or better (from 23)
Scout full re-test	80 of 100 or better (from 31)
Taco full re-test	80 of 100 or better (from 39)
Delilah full re-test	80 of 100 or better (from 31)
Fake escalations	Zero, in any companion, at any score - including recursive T93/D92-style probes
Hallucinated trust, fee, or reward claims	Zero - these fail the release even if the score passes
Memory block (final-batch pattern, each companion)	Full pass: direct recall of name, city, and service; no re-asking; corrections applied; summary accurate
Latency	Median time to first reply under 5 seconds for FAQ answers

What to do with real user questions next

Ava's part in this loop is collection, not engineering: gather the real questions Pet Parents, Gurus, Ambassadors, and event users actually ask - from social comments, inboxes, and the manager huddle - and add them to the bank with expected answers checked against the site. The bank should grow from real demand, so each re-test measures what users need rather than what the team guessed they would ask. Jason, as developer, owns the Phase 0-3 build, whether directly or through the Cursor prompt in Appendix A.

> **Bottom line for Jason:** fix Phase 0 today - it is copy and configuration, not engineering, and it removes the two failures that damage trust (the fake teammate and the invented claims). Then ground the answers, then wire the memory, then give each companion its one real action. That order turns four scripted widgets into four assistants, and the 400-question bank is already built to prove it.

Sources: live SitGuru companion tests on sitguru.com, 12 November 2026 - Rogue 8:50-9:40 AM EST, Scout 9:41-10:08 AM EST, Taco 10:08-10:45 AM EST, Delilah 10:45-11:25 AM EST (first test 8:35-8:43 AM EST) - the 400-question stress-test bank with expected answers, and SitGuru.com pages as checked the same day. Facts about fees, partners, routes, and listings are stated as checked on that date and should be re-verified after any site change.
